Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A,Note: the authors translated the codon AAA for residue 970 as Leu
C,Comment: NCAM mediates cell-cell adhesion via homophilic binding with another NCAM mole
C,Comment: Several forms of NCAM are produced by alternative splicing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of a large cytoplasmic domain for

N.Contains: poliovirus receptor beta
C.Species: Homo sapiens (man)
C.Date: 30-Jun-1993 #sequence_revision 30-Jun-1993 #text_change 09-Jul-2004
C.Accession: 312048; A31466
R.Kooike, S.; Horie, H.; Ise, I.; Okitsu, A.; Yoshida, M.; Iizuka, N.; Takeuchi, K.; Take ERBO J. 9, 3217-3224, 1990
A.;itie: The poliovirus receptor protein is produced both as membrane-bound and secreted A;feference number: S12048; MUID:91006015; PMID:2170108
A.Accession: S12048
A.Accession: S12048
A.Residues: 1-417 < KOI>
A.Kooss-references: UNIPROT:P15151; UNIPROT:Q96BJ1; EMBL:X64116; NID:g35809; PIDN:CAA454
A.Residues: C7-Ala was also found
A.Note: the gamma form has 331-Gly and lacks residues 332-384

Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer, wounds, and infectious diseases.

Disclosure; Page 182-183; 803pp; English.

The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAAB06066-8480623 encode the 12 secreted protein sequences given in AAB0506-825533. The human secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the

                                 The present sequence is a novel human cell surface receptor protein (HCSRP) designated HCSRP-8. The nucleotide sequence was identified in Incyte Clone 312256 from the cDNA library LUNGNOTO2, which was made from RNA isolated from lung tissue. A number of Incyte Clones were used to assemble the consensus sequence. BLAST analysis showed that the sequence is homologous to immuno-superfamily protein B12 g3779242. HCSRP and its antagonist are useful for preventing or treating disorders associated with decreased or increased expression or activity of HCSRP. Such disorders include cancers such as leukaemia and melanoma, immune disorders such as rheumatoid arthritis, asthma and atherosclerosis, bacterial and parasitic infections and neuronal disorders such as between a disease, multiple sclerosis and espilepsy. Polymucleotides encoding HSCRP may be used as hybridisation probes to diagnose these conditions. Anti-HCSRP matibodies may be used as
                                                                                                                                                                                                                                                                                                                           antagonists, as a targeting or delivery mechanism for bringing pharmaceutical agents into contact with cells or tissues expressing HCSRE and for disapposis of HCSRP-related disorders. HCSRP and its catalytic or immunogenic fragments are useful for drug screening using libraries of

The present amino acid sequence is the human lymphoid derived dendritic cell adhesion molecule, LDCAM. It is found on lymphoid derived dendritic cells and displays homology to adhesion molecules, B-1 and cytoplasmic region of BP-Li. Human LDCAM is expressed in breast, retina, feetal liver, spleen and heart, lung, muscle, placenta, thyroid and lung carcinoma. LDCAM polypeptides interacts with T cell surface molecules to alter signalling and inhibits T cell proliferation, bind to themselves and B7L-1, an LDCAM binding protein and increases natural killer (NK) cell populations. It may be used to measure the biological activity and as quality control reagents of LDCAM binding proteins LDCAM may be used for treating disorders associated with malfunctioning of immune system, inflammation, autoimmune disorders, viral infected cells, infectious diseases and for killing tumour cells. They are also useful for prevention or reducing the effect of corgan and bone marrow transplant rejection and for modulating T cell immune responses. LDCAM polypeptides may also be used as carriers for delivering agents attached to T cells or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel molecules designated LDCAM are capable of altering or modulating T

subject. The method comprising contacting a cell component of a proliferating cell with a reagent that detects level of the cell component in the proliferating cell and determining modification in the level of the cell component in proliferating cell as compared with a healthy cell, where modification indicates disorder associated with TSLC1. The method is useful for detecting a cell proliferative disorder (e.g. liver, lung or pancreatic cancer) associated with tumour suppressor lung cancer i (TSLC1) in a subject. The invention is useful in gene therapy and for treating a cell proliferative disorder such as lung cancer (human non-small cell lung cancer), liver cancer (hopatocaellular carcinoma) or pancreatic cancer associated with modification of TSLC1 production, where a reagent which modulates (preferably, increases) TSLC1 level in the cells, is employed. The present sequence is human TSLC1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, vulnerary, dermatological, neuroprotective, nootropic, cancer, antiparkinsonian, immunostimulant, cytostatic; immunosuppressive, antidiabetic; antiallergic, gene therapy, wound healing; tissue repair; burn; central nervous system disorder, Alzheimer's disease; Parkinson's disease; Huntington's disease; immune disorder; autoimmune disorder; multiple sclerosis; diabetes; allergy.

                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated polynucleotide (I) comprising one of 245 sequences (ABQ93288-ABQ93532). Treating a condition comprising administering to a mammalian subject a composition comprising the protein (II) encoded by (I) (ABP62809-ABB63053) or an antibody (III) to (II).

(II) and (III) are useful for diagnostic evaluation of disorders.

(I) is useful for gene therapy of diseases and (III) can be used for therapeutic treatment. Diseases that may be treated include wound healing and tissue repair, burns, central nervous system disorders (e.g. Alzheimer's, parkinson's, Huntington's and amylotrophic lateral sclerosis, diabetes and allergies. Note: The sequence data for this patent din not form part of the printed specification, but was obtained in electronic format directly from Wilco at the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences

54 identical to 18 human controllection fargures contained in American Type Culture Collection (Arcc) deposit No. defined in the specification, its species homologue, a variant of the polymuclectide having a polymuclectide capable of wariant of the polymuclectide having a polymuclectide capable of having a mucleotide sequence of only A or T residues. Also included are recombinant vectors, host cells (for producing the polympetide), the secreted polympetide (comprishing a sequence that is at least 95% category of protein, variant, allelic variant or species homologue), antibodies that specifically bind to the polympetide, diagnoshing, treating, preventing or medical condition by administering the polymetide that seal of the polympetide (comprishing a sequence that is at least 95% categories, variant, allelic variant or species homologue), antibodies that specifically bind to the polympetides, diagnoshing, treating, preventing or ameliorating a medical condition by administering the polymetide or the species homologue) and activity in a biological assay (by expressing the convergence and sequence in a cell, isolating the supernatant, and detecting an activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human secreted nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention relates to an isolated nucleic molecule that is at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Greene JM;

in a biological assay and identifying the protein in the supernatant having the activity). The polypeptides, nucleic acids and antibodies are useful for diagnosing a pathological condition or a susceptibility to a pathological condition, for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation and other immune a disorders, neurological and blood clotting disorders (many examples are given in the specification). The nucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-range restriction mapping. The polypeptides and antibodies are useful for providing immunological probes for differential identification of the tissues immunohistochemistry assays. The polypeptide, polynucleotide, agonist or antagonist may also be used as a food additive or preservative to increase or decrease storage capabilities, fat content or other intertitional components. The present is a secreted protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention.

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polyneptides or their antibodies. The polynucleotide or the compound to minum (c.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene for therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: the specification) but was obtained in electronic form directly from will on the printed for the printed for the specification and pared nerve endervential to the printed for the printed for this patent did not form part of the printed for the printed for the form of the f 181 KGNTELKGKSEVEEWSDMYTVTSQLMLKVHKEDDGVPVICQVEHPAVTGNLQTQRYLEVQ 240 New composition comprising two or more isolated polypeptides, useful for .; 0 Length 442; Indels preparing a medicament for treating pain in an animal 100.0%; Score 2283; DB 7; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid sequence, or its allelic variant, a fragment of the CDNA sequence, or its fragment, domain, epitope or species homologue. The nucleic acid is useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disease. The present sequence represents the amino acid sequence of a novel human secreted protein associated

modulating agent, by contacting an assay system comprising a purified HM polypeptide (human orthologue of genes that modify the p53 pathway in Drosophila) or nucleic acid with a test agent under conditions, where but for the presence of the test agent, the system provides a reference activity, and detecting a test agent-biased activity of the assay system. Also included are modulating (M3) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator that specifically binds to a HM polypeptide comprising an HM amino acid contacting a cell defective in p53 function size contacting the analysism of that specifically binds an HM polypeptide comprising an HM amino acid sequence, where p53 function is restored, modulating (M3) a p53 pathway. In a mammalian cell (comprising contacting the cell with an agent that specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising; (a) obtaining a biological sample of rome the patient; (b) contacting the sample with a probe for HM comparison indicates a likelihood disease). (M1) is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 % expression level. (c) ridentifying modulators of the p53 pathway, such as, angiogenesis, apoptotic or cell the p53 pathway, such as, angiogenesis, apoptotic or cell confideration of the cell, so that the cell undergoes normal confideration of the cell, so that the cell undergoes normal confideration disorders (HP p53 pathway such as angiogenic, also useful for reating defects in the p53 pathway such as angiogenic, also useful for reating defects in the p53 pathway such as angiogenic, also useful for reating defects in the p53 pathway such as angiogenic, also useful for reating defects in the p53 pathway such as angiogenic, also useful for reating defects in the p53 pathway such as angiogenic, also useful for reating defects in the p53 pathway such as angiogenic, represents a human p53 p
                                                                                                                                   invention relates to identifying (M1) a candidate p53 pathway

Funke RP; Li D, Belvin M, Francis-Lang H, Friedman L, Plowman GD,

2003-156859/15. N-PSDB; ACD13404. Identifying modulators of the p53 pathway for use in treating apoptotic or cell proliferation disorders, comprises screening for agente that modulate activity of a human ortholog of genes that modify the p53 pathway in Drosophila.

Example 2; Page 557-559; 678pp; English.

The invention relates to identifying (M1) a candidate p53 pathway

modulating agent, by contacting an assay system comprising a purified HM

colypeptide (human orthologue of genes that modify the p53 pathway in

Drosophila) or nucleic acid with a test agent under conditions, where but

for the presence of the test agent under conditions where but

correcting a cell detective in p53 pathway of a cell (comprising

contacting a cell defective in p53 function with a candidate modulator

Also included are modulating (M2) a p53 pathway of a cell (comprising

contacting a cell defective in p53 function with a candidate modulator

that specifically binds to a HM polypeptide comprising an HM amino acid

sequence, where p53 function is restored), modulating (M3) a p53 pathway

in a mammalian cell (comprising contacting the cell with an agent that

specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4)

contacting an aptient (comprising) (a) obtaining a biological sample

from the patient; (b) contacting the sample with a probe for HM

expression; (c) comparing the results with a control; and (d) determining

whether the comparison indicates a likelihood disease) (M1) is useful

for identifying modulators of the p53 pathway. A probe for HM expression

contacting applications, where disease or disorder prognosis is related

therapeutic applications, where disease or disorder prognosis is related

the p51 function of the cell, so that the cell undergoes normal

condition of the cell, so that the cell undergoes normal

condition or progression through the cell undergoes normal

conditions and the cell, so that the cell undergoes normal

conditions and the cell, so that the cell undergoes normal

conditions and the cell, so that the cell undergoes normal

conditions and the cell, so that the cell undergoes normal

conditions and the cell proliferation disorders. The present sequence

conditions and the cell proliferation disorders. The present sequence

conditions are presented and possible to the p53 pathw

Sequence 442 AA;

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, cor human polynucleotides or a polynucleotide acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound to pain and a pharmaceutical composition a method for identifying a compound useful in treating condulates its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more condulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene charapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. ```
New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                             Human, pain, neuronal tissue, gene therapy,
spinal segmental nerve injury, chronic constriction injury, CCI,
spared nerve injury, SNI, Chung.
                                                                                                                                                                                             Costigan M;

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating comprises its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human procein (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed or expected the specification but was obtained in electronic form directly from WIPO at the sequence data for this patent did not form directly from WIPO at the sequence data for this patent did not form and directly from WIPO at the sequence data for this patent did not form 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               99.9%; Score 2280; DB 7; Length 442; 99.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Domain
   The present invention describes nucleic acids encoding PRO secreted and transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-prolliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     119 RYFCQLYTDPPQESYTTITVLVPPRNLMIDIQKDTAVEGEEIEVNCTAMASKPATTIRWF 178

New human nucleic acids encoding secreted and transmembrane polypeptides which are designated as PRO polypeptides are described The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polypeptides,

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adernal, lung, colon, cursast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals and to screen for modulators of the compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gurney AL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MASVVLPSGSQCAAAAAAAPPGLRLRLLLLFSAAALIPTGGQNLFTKDVTVIEGEVA
